"Statistical Color Models with Application to Skin Detection"

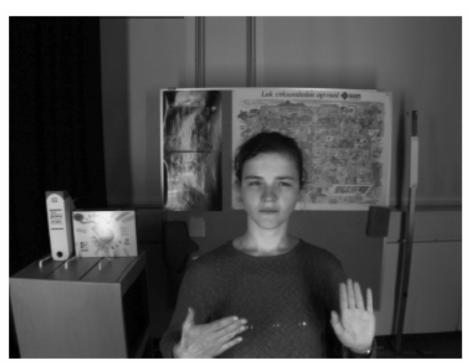

M. J. Jones and J. M. Rehg

Int. J. of Computer Vision, 46(1):81-96, Jan 2002

presented by Robert Collins

Robert Collins CSE586

Goal: Label Skin Pixels in an Image

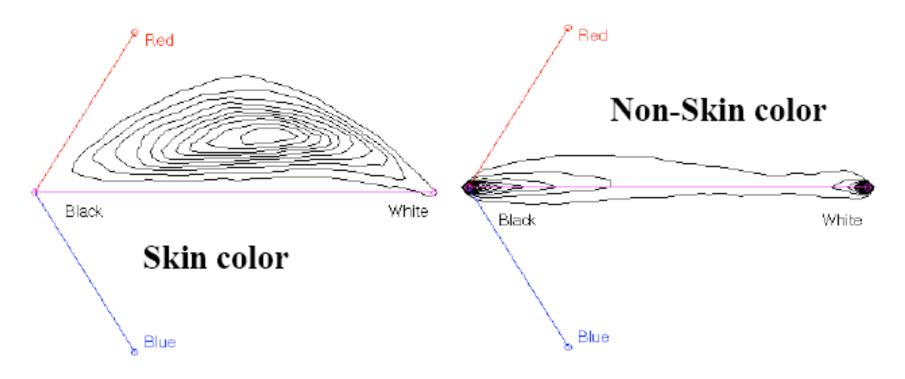

Applications:

Person finding/tracking
Gesture recognition
Flag possible adult content

General Overview

- Learn distributions of skin and nonskin color
- Histograms; Gaussian Mixture Models (GMMs)
- Bayesian classification of skin pixels
- Combining with text-based classification

Approach: Learning from Examples

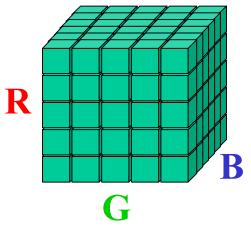

First, have some poor grad student hand label thousands of images

P(rgb | skin) = number of times rgb seen for a skin pixel total number of skin pixels seen

 $P(rgb \mid not \ skin) = \underbrace{number \ of \ times \ rgb \ seen \ for \ a \ non-skin \ pixel}_{total \ number \ of \ non-skin \ pixels \ seen}$

These statistics stored in two 32x32x32 RGB histograms

Skin histogram

Non-Skin histogram

Likelihood Ratio Classifier

Label a pixel skin if
$$\frac{P(rgb \mid skin)}{P(rgb \mid not skin)} > \Theta$$

$$\Theta = \frac{\text{(cost of false positive) P(seeing not skin)}}{\text{(cost of false negative) P(seeing skin)}}$$

$$0 \le \Theta \le 1$$

Sample Pixel Classifications

 $\Theta = .4$

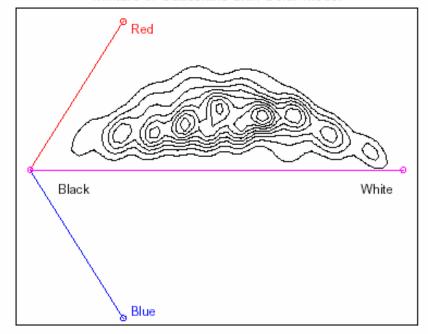

Gaussian Mixture Model

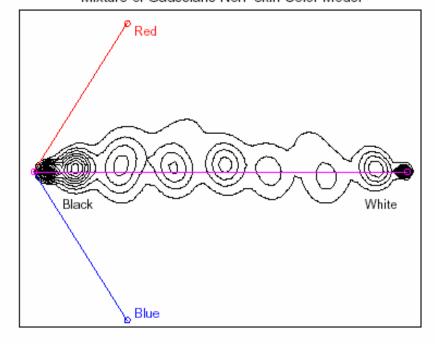

A compact description is provided by converting the histogram-based model into a Gaussian Mixture model.

$$P(\mathbf{x}) = \sum_{i=1}^{N} w_i \frac{1}{(2\pi)^{\frac{3}{2}} |\Sigma_i|^{\frac{1}{2}}} e^{-\frac{1}{2}(\mathbf{x} - \mu_i)^T \Sigma_i^{-1}(\mathbf{x} - \mu_i)},$$

Mixture of Gaussians Skin Color Model

Mixture of Gaussians Non-skin Color Model

(a) Contour plot for skin model.

(b) Contour plot for non-skin model.

Jones and Rehg Mixture Model

Mixture of Gaussian Skin Color Model

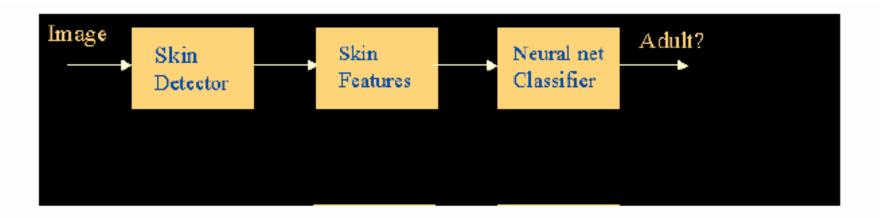

Kernel	Mean	Covariance	Weight
1	(73.53, 29.94, 17.76)	(765.40, 121.44, 112.80)	0.0294

Sample Use: Adult Image Classification

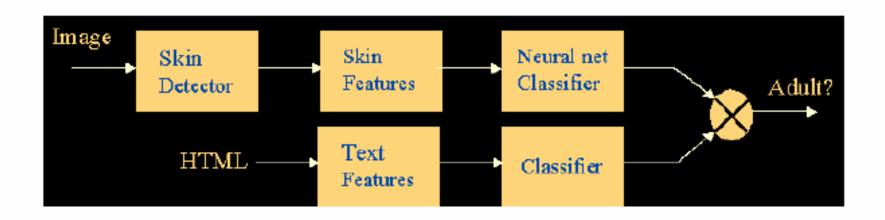

Based on Five Features:

- Percentage of pixels detected as skin.
- Average probability of the skin pixels.
- Size in pixels of the largest connected component of skin.
- Number of connected components of skin.
- Percentage of colors with no entries in the skin and non-skin histograms

Adult Image Classification

Combining Color and Text

	% correctly detected adult images	% false alarms
Color-based Detector	85.8%	7.5%
Text-based Detector	84.9%	1.1%
Combined Detector	93.9%	8.0%

Lessons Learned

- Harness the web as a source of data!
- With enough data, even simple learning methods based on counting can produce good classification results
- Likelihood ratio is important model both the object AND not-object distributions to avoid thresholds on raw probabilities.
- EM and GMM models used to encode compact descriptions of color histograms.

Questions

I wonder how k-nearest-neighbor classification would work?
